

Product/Service Information

Transporter for Tripod Aircraft Jacks

Part No. 11771-2

The Fordham transporter has been designed to transport most tripod configuration jacks with a dead weight of up to 700 Kg. and at various heights to 3.5 metres.

The transporter has been designed to link up to additional transporters to enable up to 3 jacks to be towed at the one time.

The attaching eye ring is fitted to line with standard aircraft industry towing tug attachment.

Benefits:-

- Use of a transporter reduces your labour cost as the jacks can be loaded, transported and unloaded by one operator.
- A transporter reduces wear and tear to the jack (i.e. trundle wheels, etc.) and the possible tipping of the jack should it be towed via its own trundle wheels, thus reducing your maintenance costs.
- Reduces OHS
